## LIST OF INTERCEPTED PLANT PESTS, 1938

(List of Pests Recorded During the Period July 1, 1937, to June 30, 1938, Inclusive, as Intercepted in, on, or with Plants and Plant Products Entering United States Territory.)

### INTRODUCTION

This paper covers the twenty-fifth year for which pest interception lists have been issued. The periods of time covered by the early mimeographed lists were variable. The first printed lists were issued quarterly beginning in 1915. A large part of the interceptions recorded in the early lists were made by State inspectors. After quarantine No. 37 became effective and most of the nursery stock inspection work was done by Federal inspectors, with a consequent increase in the proportion of interceptions by them, publication of the list was put on an annual basis. The first of the annual lists, however, covered 15 months, October 1, 1919, to December 31, 1920. Interceptions for the calendar years 1924 and 1925 were issued in one list, and the list was put on a fiscal-year basis again when interceptions for January 1, 1930, to June 30, 1931, were published in one list.

From the beginning interceptions have been made on a wide variety of hosts from all parts of the world. The number of interceptions made increased from less than 1,500 a year to more than 80,000 a year, even though many records formerly included were omitted from the later lists. During recent years it has been necessary to reduce drastically the recording of interceptions and to make brief summaries only for a large part of those recorded. It is believed that the records as a whole give a reasonably accurate idea of the pest status of the plant material inspected.

In the method of selecting and presenting data the present list is similar to the preceding one, but the total number of interceptions has been markedly reduced by eliminating many items formerly recorded, particularly at the port of New York. Information on which the list is based is on file in the Washington office. The bulk of this information is in the form of routine reports from regular employees and from State and customs officials who are collaborators of the Bureau.

While the States of California and Florida and the Territory of Hawaii have staffs of specialists to make their determinations, most of the insects intercepted elsewhere are determined by specialists of the Bureau, and many of the more difficult plant-disease interceptions are determined by specialists of the Bureau of Plant Industry.

Statements as to the origin of plant materials inspected cannot always be verified, but every reasonable effort is made to obtain the correct origin. Obviously doubtful items are omitted from the lists of interceptions under the countries of alleged origin.

### NOTES ON INSECTS INTERCEPTED

#### FRUITFLIES

The following fruitflies were intercepted: *Anastrepha distincta* in *Inga* sp. from Mexico; *A. grandis* in pumpkin from Brazil; Mexican fruitfly (*A. ludens*) in apple, avocado, grapefruit, mango, orange, pomegranate, quince, sapote, sour orange, and sweet lime from Mexico; *A. mombinpraeoptans* in mango and purple mombin from the Dominican Republic, mango from Haiti, and jobo de la India and mango from Puerto Rico; *A. serpentina* in mamey, sapote, and tangerine from Mexico; *A. suspensa* in guava from Puerto Rico; *Anastrepha* sp. in orange from Brazil, guava and mango from Costa Rica, almond, hog-plum, guava, and mango from Cuba; star-apple from Ecuador, mango from Haiti, Honduras, and Jamaica, apple, guava, mamey, mango, orange, peach, pear, pomegranate, quince, sapote,

sour orange, and white sapote from Mexico, mango from Panama, golden-apple, guava, and sapodilla from Puerto Rico, and mango from Trinidad; Mediterranean fruitfly (*Ceratitis capitata*) in apple from Australia, fig, loquat, pear, strawberry guava, sweet pepper, and tangerine from Azores, (pupae) in case of tangerines and oranges and (larva) on paper wrapper for tangerine from Cyprus, peach from France, pomegranate, quince (pupae) in basket of quinces and pomegranates, and (pupae) on paper wrapper for peaches from Greece, avocado, bell pepper, coffee berry, and mango from Hawaii, citron, hawthorn, orange, pear, persimmon, pomegranate, pricklypear, quince, tangerine, (pupae) in bag of oranges, (larvae and pupae) on peach and in container for peaches, (pupae) in box of tangerines, and (larvae, pupae, and adults) in trunk containing various fruits from Italy, loquat from Madeira Islands, orange and tangerine from Portugal, orange from Southeast Africa and Spain, and (larvae) among three pounds of oranges of unknown origin at a New York pier; *Ceratitis* sp. in red chili pepper from the Straits Settlements and apple and pear from the Union of South Africa; melon fly (*Dacus cucurbitae*) in cucumber from the Philippines; olive fruitfly (*D. oleae*) in olive and (adults) in package and trunk containing olives from Italy; *Dacus* sp. in pomelo from Ceylon; celery fly (*Philophylla heraclei*) in celery from England; apple maggot (*Rhagoletis pomonella*) in manzanita from Mexico; *Rhagoletis* sp. in black walnut and *Crataegus* from Mexico; papaya fruitfly (*Torotrypana curvicauda*) in papaya from Bahamas and Cuba; trypetid in orange from Africa, Crassulaceae from Arabia, *Acanthopanax* sp. from China, and *Heliconia* sp. from unknown origin.

#### INSECTS OTHER THAN FRUITFLIES

Larvae of *Acrolepia assectella* (Plutellidae) were intercepted in leek leaves from Netherlands. The citrus blackfly (*Aleurocanthus woglumi*) arrived on leaves of *Citrus* sp. and sour lime from Cuba. *Anuraphis cynariella* was taken on globe artichokes from Algeria, France, and Italy. The weevil *Apion carduorum* infested globe artichokes from France, Italy, and Netherlands. *A. cracca* arrived with vetch from England and Scotland. Turnips in ships' stores from Algeria and Portugal were attacked by the weevil *Baris laticollis*. *B. lepidii* was found in horseradish from Czechoslovakia. The turnip gall weevil (*Ceutorhynchus pleurostigma*) was intercepted in rutabagas and turnips from England and turnips from Belgium, Denmark, France, Germany, and Scotland. The Asiatic rice borer (*Chilo simplex*) arrived with rice straw from China, France, Japan, and Manchuria and with a wisteria plant from Japan. *Chionaspis wistariae* (Coccidae) was found on wisteria from Japan. *Conotrachelus aguacatae* (Curculionidae) infested avocados from Mexico. The banana root borer (*Cosmopolites sordidus*) arrived with a banana root from Honduras. *Crocosema plebeiana* (Olethreutidae) infested okra from Cuba and Mexico. Chestnuts from Italy were attacked by the weevil *Curculio elephas*. Potatoes from Mexico were infested with the potato weevil (*Epicaerus cognatus*). The West Indian sweetpotato weevil (*Euscepes postfasciatus*) was intercepted in sweetpotato from American Virgin Islands, Barbados, Brazil, Mexico, Puerto Rico, and St. Vincent. *Erosoma lusitanica* (Chrysomelidae) was found in cipollino from Morocco. *Gnorimoschema gudmanella* (Gelechiidae) infested peppers (*Capsicum annuum*) from Mexico. Larvae of the turnip mud beetle (*Helophorus rugosus*) were taken in turnips from France. *Hoplandrothrips reynei* was found on orchids from Colombia. *Laspeyresia splendana* (Olethreutidae) was intercepted in chestnuts from Italy, Japan, Portugal, Switzerland, and Yugoslavia. *Lepidosaphes camelliae* (Coccidae) was found on *Camellia* from China and Japan. The bean pod borer (*Maruca testulalis*) was intercepted in lima beans from Cuba, string beans from Japan and Mexico, pigeon peas and string beans from Puerto Rico, and on leis from Hawaii. *Megastigmus aculeatus* (Callimomidae) infested rose seed from Austria and Union of Soviet Socialist Republics. Orchids from the Philippines were attacked by *Mertila malayensis* (Miridae). A larva of the pineapple weevil (*Metamasius ritchiei*) was found in a pineapple from Mexico. *Micrelus ericae* (Curculionidae) arrived with heather from England, Germany, and Scotland and with soil around heather from Ireland. *Mordellistena cattleyana* (Mordellidae) infested orchids from Colombia and Guatemala, and *M. chapini* was found in a *Cattleya* leaf from Colombia. *Napomyza lateralis* (Agromyzidae) was taken in witloof leaves from Belgium and France. *Naupactus xanthographus* (Curculionidae) arrived with grapes from Argentina. The yam weevil (*Palaeopus costicollis*) was found in sweetpotato from Jamaica and yams from China and Jamaica. The pink bollworm (*Pectinophora gossypiella*) was intercepted in cotton bolls from Dominican

Republic and Mexico, cottonseed from Bahamas, Brazil, Dominican Republic, Egypt, Grenada, Mexico, Montserrat, and Puerto Rico, seed cotton from Italy, Mexico, and Uganda, and seed cotton adhering to old bagging from Mexico. *Poliaspis pini* (Coccidae) was taken on pines from Japan. Larvae of the vine moth (*Polychrosis botrana*) were intercepted on a grape berry from Italy. A larva of the Japanese beetle (*Popillia japonica*) was taken in soil around a chrysanthemum root from Japan. Lemon and orange from the Philippines were infested with the Philippine orange moth (*Prays citri*). *Psylliodes chrysocephala* (Chrysomelidae) arrived with broccoli from Italy, radish from Portugal, and turnips from England, France, Italy, and Mexico. The pear tingid (*Stephanitis pyri*) was found on persimmon from Italy. The mango weevil (*Sternonchetus mangiferae*) was taken in mangoes from Hawaii and New Zealand. *Taeniothrips dianthi* was found on a carnation leaf from Yugoslavia, and *T. ericae* infested aster from England and heather from Germany and Scotland. *Tenthecoris bicolor* (Miridae) was intercepted on orchids from Colombia and Venezuela.

### NOTES ON PLANT DISEASES INTERCEPTED

Among the plant diseases intercepted during the fiscal year 1938 were several well known as being serious on important economic hosts. Among the diseases were citrus canker (*Bacterium citri*), banana leaf spot (*Cercospora musae*), cereal rusts and smuts, and citrus black spot (*Phoma citricarpa*). Other diseases were intercepted which might prove to be important if introduced but which were caused by new species or were on unreported hosts and their economic status not determinable.

For convenience some of the more interesting plant disease interception records are summarized by groups in alphabetical arrangements.

#### BACTERIAL DISEASES

Citrus canker (*Bacterium citri*) was intercepted on lemon from Straits Settlements, on lime from Egypt (2), the Philippines, and Straits Settlements, on orange from China (3) and Japan (9), on pomelo from China and Straits Settlements, on tangerine from Japan (2), and on lime and orange of unknown origin, the orange in baggage from Canada. *B. hyacinthi* was intercepted but once during the year, in a hyacinth bulb from Netherlands. Pumpkins from Japan and Straits Settlements were found with bacterial spots such as are produced by *B. lachrymans* on other cucurbits.

We have no adequate facilities available for the determination of bacterial diseases, hence many bacterial infections are not determined.

#### FUNGOUS DISEASES

A considerable number of fungous diseases not heretofore represented in our interception records were added during the year. Some of these were intercepted prior to the beginning of this fiscal year but not determined in time to be included in the preceding list. Among the new entries for this year were *Ascochyta achlydis* on *Achlys triphylla* from British Columbia; *Botrytis squamosa* on garlic from Chile; *Cercospora musae* on banana from Guatemala, Honduras, and Java; *Dendrodochium cattleyae* on orchid from Colombia; *Dicheria guianensis* on *Lonchocarpus* from British Guiana; *Erysiphe umbelliferarum* on parsnip from Germany and Netherlands; *Fabracea maculata* on quince from Union of South Africa; *Gloeosporium bidgoodii* on orchid from Colombia; *G. dendrobii* on orchid from Japan; *G. leguminum* on mesquite from Mexico; *G. orchidearum* on orchid from Brazil; *Hemileia oncidi* on orchid from Brazil; *Hendersonia oryzae* on rice straw mat from Japan; *H. pecki* on honeysuckle from Sweden; *Heterosporium trillii* on *Trillium* from British Columbia; *Hormodendron cladosporioides* on tomato from France; *Leptothyrium castaneae* var. *quercus* on oak from England; *Lophodermium juniperinum* on juniper from Sweden; *Macrophoma hippoglossum* on *Ruscus* from Italy; *M. orchidicola* on orchid from Guatemala; *Marsonia juglandis* on walnut from Italy; *Microdiplodia passeriniana* on palm from Morocco; *Monochaetia compla* var. *ramulicola* on rose stock from Netherlands; *Mycosphaerella opuntiae* on cactus from Mexico; *Myrothecium verrucaria* on tomato from Mexico; *Oidium hortensiae* on hydrangea from Scotland; *Ovularia obliqua* on *Rumex* from Mexico; *Pestalozzia bicolor* on willow ties from Argentina; *Phaeochora chamaeropsis* on palm from Morocco; *Phaeosphaerella ephedrae* on *Ephedra* from China; *Phoma hippoglossi* on *Ruscus* from Italy; *P. rimosa* on *Phragmites* from Netherlands; *Phomopsis aucubae* on *Aucuba* from Italy, Japan, and Sweden; *P. conorum* var. *naviculisporea*

on spruce cone from Germany; *P. juglandina* on walnut from Poland; *P. magnoliicola* on magnolia from Japan; *P. seposita* on wisteria from Japan; *P. tineae* on viburnum from Italy; *Phyllosticta auerswaldii* on box from Germany; *P. codiaeicola* on croton from Bermuda; *P. danoes* on *Ruscus* from Italy; *P. hibisci* on *Hibiscus* from Bermuda; *P. ruborum* on raspberry from Switzerland; *Phytophthora capsici* on tomato from Mexico; *Puccinia angustata* on *Scirpus* from Spain; *P. incondita* on *Solanum* from Mexico; *P. pimpinellae* on anise from Mexico; *P. tageticola* on *Tagetes* from Mexico; *Rhabdospora ramealis* on *Rubus* from England; *Sclerophoma* (*Phoma*) *strobiligena* on pine from England and spruce from Germany; *Septobasidium prunophilum* on plum from Japan; *Septoria alliorum* on leek from France; *S. stellariae* on chickweed from Italy; *S. weissii* on chervil from Italy; *Sphaeronema talcahuense* on *Cryptocarya* from Australia; *Trematosphaeria cactorum* on cactus from Mexico; *Uredo behnickianum* on orchid from Panama; *U. guacae* on orchid from Costa Rica; *Uromyces commelinae* on wandering jew from Mexico; *U. limonii* on sea-lavender from Union of South Africa; *U. loti* on lotus from Turkey; *Verticillidium tubercularioides* on walnut from Poland; and *Volutella albido-pila* on orchid from the Philippines.

A number of the fungi intercepted did not appear to belong in species described as occurring on the hosts affected and were determined tentatively if at all. Included in this group are *Anthostomelia* sp. (unlike either of the two species described on orchids) on *Oncidium speciosum* from Mexico; *Cladosporium* sp. (undescribed) on croton leaf from Mexico; *Collectotrichum* sp. (no species reported on the host genus) on *Stapelia* sp. from Arabia and Uganda; *Cytospora* sp. (no species reported for host) on *Macrozamia* from Australia; *Didymosphaeria* sp. (no species reported on host) on freesia leaves from Netherlands; *Gloeosporium* sp. (probably undescribed) on *Cattleya gigas* from Colombia; *Gloeosporium* sp. (unlike described species) on globe artichoke from England; *Helminthosporium* sp. or spp. (unlike species reported on host) on tomatoes from Haiti and from Mexico; *Macrophoma* sp. (no species reported on host) on ismene lily from Azores; *Macrophoma* sp. (with spores smaller than those of *M. paeoniae*) on *Paeonia suffruticosa* from Japan; *Ophiobolus* sp. (no species reported on orchids) on *Oncidium cavendishianum* from Guatemala; *Peridermium* sp. (no species reported on host) on *Pinus halepensis* from Italy; *Pestalozzia* spp. (no species reported on hosts) on *Limonium* sp. from Union of South Africa and on *Oncidium bicallosum* and *Stanhopea wardii* from Guatemala; *Phomatospora* sp. (no species described on host) on *Camellia japonica* from Japan; *Phyllosticta* n. sp. on holly from Yugoslavia; *Phyllosticta* sp. (unlike species reported on orchids) on *Laelia* sp. from Mexico; *Phyllosticta* sp. (*P. laeliae*? with small spores) on *Oncidium ornithorhynchum* from Guatemala; *Phyllosticta* sp. (no species reported on host) on *Schizocodon macrophyllum* from Japan; *Rhabdospora* sp. (no species reported on host) on *Paeonia moutan* from Japan; *Sclerotium* spp. (undetermined, apparently not reported on hosts) on *Camellia japonica* from Japan, on *Carum carvi* from Netherlands, on *Lycoris radiata* and *Lycoris* sp. from Japan, on mango seed from Sierra Leone, and on *Nerine appendiculata* and *N. sarniensis* from Union of South Africa; *Sphaerulina* sp. (apparently undescribed) on *Paeonia moutan* and *P. suffruticosa* from Japan; *Uredo* sp. (no rust reported on host) on *Mazillaria* sp. from Venezuela; and *Ustilago* sp. (unlike species on host) on *Phalaris canariensis* from Morocco.

Diseased seeds were found on a number of occasions, these interceptions including *Erysiphe umbelliferarum* on parsnip seed from Germany and Netherlands; *Fusicladium depressum* (with shorter spores than the description gives) on *Foeniculum vulgare* seed from India and *F. depressum* on *Foeniculum* sp. seed from Hungary and from Union of Soviet Socialist Republics; *Gloeosporium ulmicolum* on elm seed from Canada; *Phoma samararum* on *Fraxinus excelsior* seed from Italy; *Phomopsis tineae* on *Viburnum tinus* seed from Italy; *Sclerotium* spp. on *Carum carvi* seed from Netherlands, on mango seed from Sierra Leone, *Pyrethrum* sp. seed from England, and on acorns from England; and *Ustilago* sp. (unlike species reported as affecting seed of host) in seeds of *Phalaris canariensis* from Morocco.

Among the important or unusual fungous disease interceptions not included in the foregoing paragraphs were *Cephalosporium pammelii* var. *purpurascens* on apple from Japan; *Cercosporella albomaculans* on cabbage from Japan; *Diaporthe perniciosa* on apple from Morocco; *Elsinoe phaseoli* on lima beans from Cuba; *Macrophoma oncidii* on orchids from Brazil, Canal Zone, and the Philippines; *Phoma citricarpa* on citrus from China and Japan; *Phyllosticta laeliae* on orchid from Mexico; *Puccinia cannae* on canna from Mexico; *Pucciniastrum myrtilli* on azalea from Switzerland; *Tilletia horrida* in rice hulls from Japan and from the Philippines; *Uredo jatrophiicola* on *Jatropha* from Puerto Rico; and *Verticillium*

*albo-atrum* on dahlia from Belgium, Germany, Italy, and Netherlands, on *Ere-murus* from Netherlands, and on *Ficus* from Italy.

Numerous interceptions of cereal rusts and smuts were made which may represent strains not present in this country, but as their status could not be determined and the species are common no detailed record of them was prepared.

#### VIRUS DISEASES

Virus diseases constitute a serious quarantine problem because, though destructive, they cannot be detected, even when present, in most types of plant material offered for entry, and even if detected their specific identity could not be determined in many cases. Reports were received of heavy losses from virus diseases in imported lily bulbs, diseases which could not be detected in the bulbs at the time of entry and inspection.

Mosaic was intercepted in *Gloriosa superba* from the Virgin Islands and lilies from Bermuda; spotted wilt of tomato, was intercepted from Mexico.

#### NEMATODE INTERCEPTIONS

Twenty interceptions of *Anguina tritici* were made in seed wheat from Afghanistan and three in wheat from Turkey. *Aphelenchoides bicaudatus* was intercepted in ginger from China; *A. fragariae* in lily-of-the-valley from Germany and lilies from Netherlands; *A. limberi* in dahlia from Germany; *A. parietinus* in various hosts from Azores, Belgium, China, Denmark, Dominican Republic, England, France, Germany, Italy, Jamaica, Japan, and Netherlands; *Aphelenchus avenae* on various hosts from Belgium, Denmark, France, Germany, Italy, Morocco, Netherlands, and Union of South Africa; *Ditylenchus dipsaci* in various hosts from Denmark, England, France, Germany, Guernsey, Netherlands, Norway, Poland, Sweden, and Uruguay; *D. intermedius* on yam from Puerto Rico; *Heterodera marioni* on new or unusual hosts for our interception files, including *Adromischus trigynus* from Germany, *Anemone nemorosa* and its variety *robinsoniana* from Canada, *A. tessiri* from Germany, *Coptis quinquefolia* from Japan, *Convolvulus incanus* from England, *Echeveria* spp. from Mexico, *Hibiscus* sp. from Mexico, *Lobivia graulichii* and *L. schudtii* from Japan, *Melocactus matanzanus* from Cuba; *Pachyrhizus erosus* from China, *Pachysandra terminalis* and *Sarcococa ruscifolia* from England, and *Urbinia purpusii* from Japan; *Hexatylus* n. sp. in ginger from China; *Neotylenchus* probably *abulbosus* in turnip from Wales; *Pratylenchus pratensis* in lily-of-the-valley from Germany, yam from Jamaica, and potato from Mexico; *Rotylenchus bradyi* in yam from Puerto Rico; *R. robustus* in soil around roots of a century plant from Italy; and *Tylenchus filiformis* in *Araucaria* from Germany.

#### COMMON PESTS INTERCEPTED

Many pests commonly found on their hosts in the United States are intercepted more or less frequently. At times such interceptions have indicated the occurrence of some of these pests in countries from which they had not been reported. Some of these common pests intercepted may represent strains differing markedly in host reactions from the strains already established here. However, we have no ready means of determining the possible importance of common pests intercepted and no longer record most of them. It is believed that the interceptions listed in these paragraphs are sufficiently representative of this type of material. In addition to diseases common in this country, one disease (*Elsinoe phaseoli*) which occurs in Puerto Rico but is not known to occur in the continental United States has been intercepted so frequently on lima beans from Cuba that its interception has been recorded as though it were a common pest.

The two sets of figures in parentheses following each pest name indicate the number of countries from which the pest was intercepted and the total number of interceptions.

#### INSECTS

*Acanthoscelides obtectus* (10—398), *Ahasverus advena* (21—109), *Aonidiella aurantii* (18—85), *Aphis gossypii* (15—297), *A. rumicis* (5—26), *Araecerus fasciculatus* (16—24), *Aspidiotus camelliae* (9—20), *A. cyanophylli* (11—47), *A. hederæ* (16—92), *A. lataniae* (21—169), *A. perniciosus* (7—14), *Aulacaspis pentagona* (10—22), *A. rosae* (3—3), *Brevicoryne brassicae* (11—38), *Carpocapsa pomonella* (17—83), *Cathartus quadricollis* (4—86), *Cavariella capreae* (6—26), *Cerataphis lataniae* (13—61), *Ceroplastes floridensis* (5—30), *Chionaspis citri* (8—24), *Chry-*

*somphalus aonidum* (18—408), *C. dictyospermi* (20—176), *Coccus elongatus* (5—19), *C. hesperidum* (17—47), *Diaspis boisduvalii* (23—231), *D. bromeliae* (7—38), *D. echinocacti* (13—50), *Ephestia cautella* (19—80), *Etiella zinckenella* (5—28), *Gnorimoschema operculella* (25—189), *Heliothis obsoleta* (7—1,507), *H. virescens* (4—74), *Heliothrips haemorrhoidalis* (9—21), *Howardia biclavata* (8—75), *Ischnaspis longirostris* (10—23), *Lasioderma serricorne* (12—139), *Lepidosaphes beekii* (46—664), *L. gloverii* (13—136), *L. ulmi* (18—75), *Macrosiphum solanifolii* (9—144), *Myzus persicae* (14—158), *Necrobia rufipes* (10—18), *Oryzaephilus surinamensis* (14—127), *Parlatoria pergandii* (20—105), *P. proteus* (11—70), *Pinnaspis aspidistrae* (7—43), *P. minor* (10—104), *Plodia interpunctella* (16—294), *Pseudaonidia articulatus* (20—88), *Pseudococcus adonidum* (19—44), *P. brevipes* (17—511), *P. citri* (26—124), *P. maritimus* (23—105), *P. nipae* (10—26), *Rhizoglyphus hyacinthi* (10—28), *Rhizopertha dominica* (3—30), *Saissetia hemisphaerica* (26—244), *S. nigra* (8—34), *S. oleae* (18—36), *Sitophilus granarius* (6—15), *S. oryza* (16—885), *Sitotroga cerealella* (9—45), *Stegobium paniceum* (11—49), *Tenebroides mauritanicus* (15—55), *Thrips tabaci* (22—201), *Tribolium castaneum* (19—121), *T. confusum* (3—57), *Typhaea stercora* (13—52).

In addition to the listed species of common insects, there were 4,627 interceptions belonging to 569 different species which were not deemed to be of sufficient importance from the plant quarantine viewpoint to warrant listing them by species. Total of insects included in this paragraph, 14,074.

#### DISEASES

*Acrostalagmus cinnabarinus* (1—1), *Actinomyces scabies* (31—213), *Albugo candida* (5—38), *Alternaria brassicae* (9—25), *A. herculea* (11—24), *A. radicina* (7—15), *A. solani* (2—5), *Aspergillus niger* (34—156), *Bacillus carotovorus* (21—52), *Bacterium campestre* (2—2), *B. maculicola* (13—32), *B. marginatum* (6—285), *B. tumefaciens* (7—25), *B. vesicatorium* (9—627), *Botrytis cinerea* (32—198), *Bremia lactucae* (4—12), *Capnodium citri* (15—21), *Cephalothecium roseum* (14—52), *Ceratosomella adiposum* (2—22), *C. paradoxa* (13—169), *Cercospora apii* (3—3), *C. beticola* (2—7), *C. capsici* (4—117), *C. neriella* (1—8), *C. rosicola* (3—11), *Cladosporium carpophilum* (3—14), *C. cucumerinum* (3—4), *C. fulvum* (4—10), *C. herbarum* (5—9), *Colletotrichum circinans* (4—17), *C. lagenarium* (8—13), *C. lindemuthianum* (11—22), *Coniothyrium fuckelli* (2—7), *Corticium vagum* (34—317), *Diaporthe phaseolorum* (1—73), *Diplocarpon rosae* (4—9), *Diplodia natalensis* (17—57), *D. tubercicola* (7—9), *D. zeae* (3—6), *Elsinoe fawcettii* (16—45), *E. phaseoli* (1—550), *Erysiphe graminis* (4—29), *Fusarium moniliforme* (3—14), *Gibberella saubinetii* (1—1), *Gloeosporium limeticolum* (14—240), *G. musarum* (4—7), *Glomerella cingulatum* (26—234), *Graphiola phoenixis* (5—12), *Helminthosporium allii* (12—100), *H. oryzae* (2—4), *H. sativum* (7—52), *Heterodera marioni* (21—81), *Heterosporium allii* (6—7), *Leptothyrium pomi* (10—12), *Macrosporium solani* (1—1), *M. tomato* (1—7), *Melanconium sacchari* (8—18), *Mycosphaerella brassicicola* (8—20), *M. pinodes* (7—8), *Nigrospora sphaerica* (3—4), *Oospora citri-aurantii* (2—6), *O. lactis parasitica* (7—13), *O. pustulans* (3—6), *Penicillium digitatum* (22—76), *P. expansum* (7—18), *P. gladioli* (7—19), *P. italicum* (17—37), *Peronospora parasitica* (4—10), *Pestalozzia quepini* (4—16), *Phoma betae* (1—1), *P. destructor* (4—475), *P. lingam* (3—4), *Phomopsis citri* (35—135), *P. versans* (10—116), *Phytophthora infestans* (24—294), *Puccinia antirrhini* (1—2), *P. chrysanthemi* (2—2), *P. coronata* (3—5), *P. glumarum* (2—2), *P. graminis* (25—161), *P. hieracii* (2—2), *P. malvacearum* (3—5), *P. menthae* (2—9), *P. porri* (6—14), *P. rubigo-vera* (12—77), *P. sorghi* (1—4), *Rhizopus nigricans* (35—165), *Sclerotinia sclerotiorum* (24—134), *Sclerotium oryzae* (4—17), *Septoria apii* (18—40), *S. petroselinii* (11—21), *Sphaceloma persea* (2—9), *Sphacelotheca sorghi* (2—3), *Spondylocadium atrovirens* (31—967), *Spongospora subterranea* (14—43), *Tilletia foetans* (2—2), *T. laevis* (4—18), *Uromyces appendiculatus* (1—1), *U. caryophyllinus* (3—9), *Ustilago hordei* (2—2), *U. tritici* (3—3), *U. zeae* (4—10), *Venturia inaequalis* (26—141), *V. pyrina* (10—20), *Verticillium cinnabarina* (24—133). Total of these disease interceptions, 7,382.

#### INCOMPLETELY DETERMINED PESTS

Many intercepted insects and plant diseases cannot be determined with accuracy. Material may be scanty and in poor condition. The life histories of some insects are imperfectly known, or in the stage present two allied species may be almost indistinguishable, or the one or two specimens obtained may not be quite

typical. In the case of plant pathogens the fruiting stages necessary for a determination may be lacking. While a few intercepted insects in immature stages have been reared at times and on rare occasions plant-disease organisms have been cultured and their identity established, there is no provision for the routine determination of immature insects by rearing or of plant diseases by culturing. While it is possible to determine many well-known pests in any stage of development, it would be highly desirable to make more comprehensive studies of unknown insects and diseases which cannot be determined by the means available and which may be potentially dangerous. This is especially true of plant pathogens, which are so often present in forms that are not detected by practicable general inspection methods.

#### INSECTS

Of the insect pests intercepted a total of 266 could be determined to family, subfamily, or tribe, only. A total of 6,092 other lots of insect pests, determined to genus only, were distributed among 667 genera. The largest number of interceptions included under any one of these 667 genera is 620 under *Frankliniella*, which arrived from 10 countries on 80 different hosts. Under *Pseudococcus* sp. there are records of 309 interceptions from a total of 41 countries and 104 hosts. Under *Euxesta* sp. there were 191 interceptions from 19 countries and associated with 42 different hosts. *Ceutorhynchus* sp. was intercepted 143 times from 14 countries on 10 hosts. *Chrysomphalus* sp. was taken 135 times from 21 countries on 31 hosts. Under *Diaspis* sp. there were 117 interceptions from 13 countries and 12 hosts. *Curculio* sp. arrived 97 times from 14 countries on 6 hosts. *Diatraea* sp. was intercepted 95 times from 5 countries on 4 hosts. *Conotrachelus* sp. arrived 90 times from 9 countries on 13 hosts. Under *Haplothrips* sp. there were 79 interceptions from 8 countries on 20 hosts. *Empoasca* sp. was taken 71 times from 6 countries on 26 hosts. Under *Diaphania* sp. there were 70 interceptions from 4 countries on 7 hosts.

#### DISEASES

While many of the common disease organisms are no longer reported in all cases, the total of interceptions of *Fusarium* sp. recorded was 2,060 from 79 countries or geographic subdivisions. Eighteen other genera were intercepted 25 or more times and not determined to species. Thirty-five genera were represented by one interception only, and 44 additional genera were represented by fewer than 10 interceptions each. Interceptions of *Gloeosporium* determined to genus only totaled 182 on 55 hosts belonging to 35 genera and on material from 31 countries or geographic subdivisions, including every continent. Undetermined interceptions of the closely related genus *Colletotrichum* totaled 32 on 15 hosts belonging to 12 genera and on material from 14 countries. There were 32 interceptions of *Sclerotium* sp. on 24 hosts belonging to 21 genera and on material from 13 countries. *Phyllosticta* sp. was intercepted 28 times on 24 hosts, all different genera, and from 18 countries. Undetermined interceptions of the related genus *Phoma* totaled 39 on 24 hosts belonging to 22 genera and on material from 18 countries. Fifty-two interceptions of "mosaic" were made on plant materials from Cuba and are included as determined to genus only.

One hundred and eight genera are represented in this group of incompletely determined pathogens. Total of these interceptions, 4,828.

#### ENTOMOGENOUS FUNGI

Some beneficial fungi, particularly those attacking insects, were found in the course of inspection of imported plants. These entomogenous fungi included *Aegeria webberi* on *Dialeurodes citrifolii* on citrus from Cuba; *Aschersonia aleyrodis* on *Dialeurodes citri* on citrus from Bahamas; *A. cubensis* on *Coccus hesperidum* on guava from Cuba; *Cephalosporium lecanii* on *Coccus viridis* on coffee from Cuba and Jamaica; *Hirsutiella* sp. on leaf beetle on coffee from Jamaica; *Myriangium duriae* on *Lepidosaphes beekii* on orange from Cuba and Jamaica; *Nectria diploa* on *Aonidiella aurantii* on orange from Cuba, on *Chrysomphalus aonidum* on orange from the Bahamas, on *Ischnaspis longirostris* on *Ficus nitida* from Cuba, on *Lepidosaphes beekii* on citrus from Costa Rica, Cuba, and Jamaica, and on *Pseudonidia articulatus* on orange from Haiti; *Ophionectria coccicola* on undetermined host on citrus and on gardenia from Mexico; and *Scolecnectria coccicola* on undetermined host on citrus from Mexico.

*Geographic summary of interceptions listed in main table and interception totals*
